Changes to DOS environment variables

DOS environment variables are handled differently from CCPSX Ver. 3.06.0015 onwards. These changes mean that the CCPSX file retrieval location is now specified within sn.ini. Note that the C_INCLUDE_PATH, COMPILER_PATH and LIBRARY_PATH environment variables are no longer referred to. Also, more detailed specifications such as assembler_path and linker_path are now possible. Refer to pssn\sn.ini for details.

(Old)

1. Examines sn.ini within the directory specified by the SN_PATH environment variable.
2. Looks for the header in the directory specified by c_include_path. If there is no description, it refers to C_INCLUDE_PATH.
3. Looks for the GNU compiler in the directory specified by compiler_path. If there is no description, it refers to COMPILER_PATH.
4. Looks for the library in the directory specified by library_path. If there is no description, it refers to LIBRARY_PATH.

(New)

1. Examines sn.ini within the directory specified by the SN_PATH environment variable.
2. Looks for the header in the directory specified by c_include_path within sn.ini.
3. Looks for the GNU compiler in the directory specified by compiler_path within sn.ini.
4. Looks for the library in the directory specified by library_path within sn.ini.
