---

Copyright 1998 Sony Computer Entertainment Europe

This program will play back a multi-channel XA audio file on a Windows PC.  
The XA file must be in 2336 byte sector format. This program will not read  
an XA file direct from a PlayStation disc.

Required:

486-class PC  
Windows 95, 98 or NT (not tested)  
16-bit soundcard capable of 16-bit playback at 18.9KHz and 37.8KHz

Recommended:

Pentium

What's new in this version:

32-channel support!  
Fixed a bug with channels ending at different times

Known problems with this version:

Audio pauses when moving the window. BAD Windows. BAD.  
Channel changing only occurs when decoding of the next 6 sectors begins.  
Position slider is only accurate to 6 sectors when re-positioning.  
Doesn't work on Dave's PC.  
Not sure how many sound cards support 37.8KHz & 18.9KHz playback (SB16 does)
