

\$PSDocId: Document Release 1.0 for Run-time Library Release 4.0\$

prefsect renames the sections in a Psy-Q object file by prefixing the names with a defined string.

Usage: prefsect [options] infile outfile prefix

Options: -g creates a group of the same name as the prefix and puts all sections in this group

For example,

```
prefsect mod1.obj newmod1.obj psyq
```

will prefix the sections in mod1.obj with psyq.

E.g., ".text" will become "psyq.text".

In addition,

```
prefsect -g mod1.obj newmod1.obj psyq
```

will also create a group called psyq and put all the sections in this group.
